+Best fitting value as if the index started at 1000 on 4/1/2011

Core, Total Market ex-Mega, and Small/Micro Cap indexes are initialized on December 4, 2023, based as if they began at 1000 on the start of day on April 1, 2011, and their constituents each day were the composite of their underlying Mega, Mid, Small, and Micro Cap indexes.

‡Best fitting value as if the index started at 1000 on 9/10/2012

Core Cap Value and Growth index levels are initialized on December 4, 2023, based as if they began at 1000 at the start of day on September 10, 2012, and their constituents each day are estimated based on their underlying indexes. For purposes of assigning Value or Growth to a company in Core Cap each day for this calculation, the assignment uses the sum of the corresponding Large Cap and Small Cap Value or Growth style allocations

FILE LAYOUTS

- Second-by-Second file layouts for index families differ only by the number of indexes in the family. ASCII files are pipe delimited.
- The first column of all files is the DateTime field in YYYY-MM-DD HH:MM:SS format.
- Remaining columns are index levels, each identified by Index Ticker. Levels in the ASCII files are printed at 13.6. The six decimal places represent the full precision that is provided to CRSP.
- End-of-Day file layouts for index families differ only by the number of indexes in the family. ASCII files are pipe delimited.
- The first column of all files is the Date field in YYYY-MM-DD format.
- Remaining columns are index levels, each identified by Index Ticker. Levels in the ASCII files are printed at 13.6. The six decimal places are consistent with the maximum available in the second-by-second files.
